

## Steel manufacturing

We are keen to choose the best types of raw materials , as we adopt the best suppliers of raw materials in the world to ensure access to products with outstanding quality and high efficiency in order to guarantee meeting the most accurate global specifications.

# steel

---

## material with tradition and future

The history of steel goes back to 2,000 BC, to a time when the first simple ferrous materials were produced. In antiquity and the Middle Ages, ore was smelted in a kiln at very high temperatures, without actually melting. This was an inhomogeneous material that had a varying carbon content and contained no other alloying elements.

In the 14th century AD, the first charcoal-heated blast furnaces came into existence in Europe, making the melting of iron possible. The resulting cast iron was brittle due to its high carbon content and not suitable for forging. It therefore had to be meticulously processed to burn out the carbon, slag and other accompanying elements.

In 1784, Henry Cort developed the puddling process. In this process, the molten pig iron was brought into contact with air by stirring it manually to eliminate elements such as carbon, sulphur or phosphorus from the material. The procedure enabled the manufacture of a forgeable and resilient crude steel, also known as wrought iron.

In the 19th century, steel took on an increasingly important role. As the invention of the steam engine made the transportation of heavy loads possible, the coal industry

began to supply the coke necessary for steel manufacture. Steel was of great importance for the railways, steamships and defence industry. The Eiffel Tower still stands as a monument of the technical progress of that time, constructed for the Paris World Exhibition in 1889.

Since the creation of that famous Parisian landmark, steel production has grown steadily. Production processes have evolved over the years, so that today there are over 2,500

standard grades that are used in a wide variety of applications.

the railway sector was once one of the largest markets for steel .

## Why is construction steel used so frequently?

The reasons for the use of construction steels are mainly their yield strength, formability

- 📍 Cairo, EGYPT. 3 Abou Tamam st., Hadayak El Kobba. (+2) 02 233 023 99 (+2) 01 22 22 00 787

and suitability for welding and machining. The most frequently sold steel is general

or non-alloyed construction steel. This is due to the fact that:

Its properties are suitable for the most common applications;

It is cost-effective;

It has good processing and welding properties;

The variety with the required properties for machining can be selected individually

from a large number of different alloys;

A large selection of, mostly standardized, semi-finished products is available.

### **What grades of steel are there?**

The largest grouping of steels are construction steels. They are also referred to as ordinary steel or structural steel. This group accounts for more than 90 % of total

steel production. It includes unalloyed construction steels, as well as fine grain and

weather-resistant structural steels. Some corrosion-resistant stainless steels (INOX) are

classed as structural steels, too, because they are used for similar structures to those

constructed from the grades mentioned above.

In the context of this PRAXIS brochure, mainly unalloyed structural steels will be considered.

Information on stainless steel (INOX) or rust- and acid-resistant steels can be found in our PRAXIS brochure “PFERD tools for use on stainless steel (INOX)”.

## types of construction steel

### Rebars \ reinforcement steel for building

We produce steel bars in all sizes

10,12,14,16,18,20,22,25,28,32,40 mm.

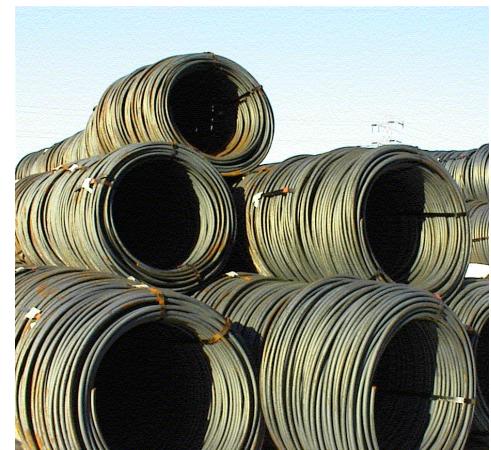

### Plain wire rod

We produce plain wire rod in all sizes from 5.5 to 16 mm.

### Rebar coils

We produce rebar coils in all sizes from 6 to 16 mm
